SUMMARY

Full-stack engineer, 2+ years, who moves across frontend, backend and infrastructure without handing off — as **sole engineer** of a live B2B compliance platform there was nobody to hand off to. I built both **React / Next.js apps** (admin panel + client portal), the async **FastAPI** and **Node.js** services behind them, and the **AWS** infrastructure and CI/CD that ships them — in a **regulated, audit-heavy domain**: immutable audit log, multi-tenant **RBAC**, evidence a reviewer can defend. Now a **Senior Software Engineer at Tracxn** (800+ person product company) on production LLM / agent systems. Founder by default — **TeachPad**, a live AI SaaS I co-built and still run at **2,000+ users**, and **StoreScope**, a Shopify app published **0→1 solo**. **Tool-agnostic**: TypeScript and Python both daily; I pick what the problem needs and ship it.

SKILLS

Languages: TypeScript / JavaScript · Python · SQL

Frontend: React · Next.js · Tailwind · Zustand / TanStack Query · Redux · real-time UI over SSE / WebSockets

Backend: Node.js (Express) · Python (FastAPI, async) · REST APIs · PostgreSQL (Prisma, SQLAlchemy) · Redis · Firebase (Firestore / Realtime — NoSQL)

Infrastructure / DevOps: AWS (EC2, RDS — Multi-AZ + backups, Lambda, API Gateway) · Docker · GitHub Actions CI/CD · health-gated deploys + auto-rollback · Sentry · Jest / pytest

Architecture: Event sourcing · **CQRS** · Durable workflows (**Temporal**) · Transactional outbox · High-throughput event ingestion · Concurrency & async design

Trust & integrations: Immutable audit logging · Multi-tenant **RBAC** · OAuth, passkeys · Third-party API integrations (Zoho CRM, Shopify, Razorpay)

AI / agents: Tool-calling agents (**60+ tools**) · Human-in-the-loop execution · **LLM-as-judge evals in CI** · LangGraph · **RAG** & vector search (Pinecone, pgvector)

EXPERIENCE

Tracxn — Senior Software Engineer

Jul 2026 – Present · Bangalore

800+ person product company (private-market research platform used by VC / PE / corporates).

- Build **production LLM / agent systems** on the company's customer-facing product surface — agentic retrieval and synthesis over a large proprietary dataset, served at product scale.

GST Manager — Sole Engineer & Technical Lead

Oct 2025 – Jul 2026 · Bangalore

B2B compliance SaaS for an Indian tax-compliance firm (GST = India's national sales tax, VAT). Sole engineer — frontend, backend, data, infrastructure and CI/CD.

- **Shipped and ran the entire product alone** — two **React / Next.js / Tailwind** apps (admin panel + client portal) on async **Python (FastAPI)** and **Node.js (Express)** services, deployed by me to **AWS** (**EC2**, **RDS Multi-AZ** with real backup/restore work, **Lambda**) behind health-gated deploys with auto-rollback and ~14 CI guard scripts. Frontend, backend and infrastructure were one job, not three handoffs.
- Built the **compliance backbone** — an event-sourced **87-model PostgreSQL** system of record with an **immutable audit log**, multi-tenant **RBAC**, OAuth and passkey auth, and a CI-enforced write path, so every state change in an audit-heavy regulated domain stays reconstructable and defensible.
- Made it durable and live — **Temporal** workflows that survive retries and restarts; **CQRS** read models on Redis; a transactional outbox for exactly-once side effects; live chat across both portals over **SSE** + Redis pub/sub with read receipts and delivery states.
- Shipped a production **AI command center** — a Claude **tool-calling agent (60+ tools)** that plans and executes real operations against the platform, with **human-in-the-loop approval** on every write, gated by an **eval + regression harness** that judges each prompt and model change in CI.

TeachPad — Co-Founder & Engineer

Apr 2025 – Present · teachpad.in

AI teaching-prep SaaS, co-founded and still running; one of three equal contributors.

- Own the backend of a live product now at **2,000+ users** — async **FastAPI** on PostgreSQL / **Supabase**, a **RAG** pipeline (Pinecone + Gemini) grounding every generation in source material, plus usage quotas and **Razorpay** billing. Taken **0→1** and grown while holding a full-time role — every call a scope-versus-speed trade-off made against real users.

StoreScope — Founder & Sole Engineer

Jun 2025 – Present · apps.shopify.com/storescope

Published Shopify app — real-time customer-journey & abandonment analytics for merchants.

- Took an ambiguous idea to a **published App Store product solo, 0→1** — high-throughput **event-ingestion pipeline**, Shopify **OAuth install flow**, and usage-tiered billing with per-store quota enforcement at the **API Gateway** edge.

RELSO — Tech Lead

Mar 2024 – Sep 2025 · **Fully remote** (US team)

US direct-to-consumer furniture startup; led a two-engineer team.

- **Tech lead** of a two-engineer team — architecture, standards, code reviews — while shipping the company's Shopify storefront front to back, eighteen months **fully remote** across US timezones.
- Built a production **LangGraph multi-agent assistant** that reasons over multi-step queries and calls **external APIs** (**Zoho CRM**, **Shopify**) to answer live inventory questions and execute writes.
